

Code Review Check List

Things you must and should do when reviewing someone's code.

1. Unshelve the code and compile it -- does it build successfully?
2. Test the code -- does it work as intended?
3. Run StyleCop on the files -- are there any errors? If so, are these errors in the code that was added?
4. Are there unit tests that exercise the code? If so, run them and be sure they pass. If not, ask why not.
5. If you have Resharper, run 'Find Code Issues'. Is the new code free from issues?
