Code Review Check List

Things you must and should do when reviewing someone's code.

- 1. Unshelve the code and compile it -- does it build successfully?
- 2. Test the code -- does it work as intended?
- 3. Run StyleCop on the files -- are there any errors? If so, are these errors in the code that was added?
- 4. Are there unit tests that exercise the code? If so, run them and be sure they pass. If not, ask why not.
- 5. If you have Resharper, run 'Find Code Issues'. Is the new code free from issues?
