WordPress Setup Checklist

10 essential things to do after installing WordPress Site

Backup Solution

- [ ] Add backup plugin like Backup WordPress and set it up to take regular backup to a remote location such as Dropbox or Amazon S3.

Security Measures

- [ ] Add a security plugin like Wordfence and set it up to block brute-force password attacks and enable firewall protection.

Enable Caching

- [ ] Add a caching plugin like WP Super Cache and turn on post and page caching to speed up the site for users.

SEO & Sitemap

- [ ] Add a SEO plugin like Yoast SEO and set up Google and Bing Webmaster verifications, sitemaps and default title and meta settings.

Comment Spam Prevention

- [ ] Add a plugin like Akismet which can help block unwanted comment spam which otherwsie downgrade the quality of the site.

Analytics

- [ ] Analytics is essential to analyze the growth of the site and you can use a Google Analytics plugin or Jetpack analytics to collect metrics.

Contact Form

- [ ] Make sure you have a way for your visitors to contact you for sending feedback and reporting site issues.

Image Optimization

- [ ] unoptimized images are the biggest reason for a slow site and a plugin like EWWW Optimizer can ensure that every image size is trimmed down.

Social Integration

- [ ] Ensure your social profiles are present on the site and users have a way to share your posts and pages via Share Buttons.

Uptime Monitor

- [ ] Downtime can hurt your site badly thus having constant monitoring of your site via a service Like Jetpack Monitor or Uptime Robot is a must.
